

PST Shaftless Spiral Conveyors Boiler Plants

PST Shaftless Spiral Conveyors are widely used by boiler plants and thermal power plants. We transport the most common types of biofuels such as sawdust, bark, wood chips, olivecake, straw, grain, etc., as well as pellets and briquettes.

A common requirement in the boiler plant is to lift the material to different levels. The PST V-System (vertical)

with the feeding conveyor, vertical conveyor, and with or without a top conveyor has proved an effective system in terms of capacity, layout optimisation and cost effectiveness.

PST transport different types and sizes of ash such as fly ash and bottom ash. We have also different solutions available to cool and remove the ash.

Shaftless Spirals since 1982

Certified in accordance with ISO 9001
